

Tablekeeper

Tablekeeper

A restaurant booking app with three live AI agent seats

WeAreDevelopers x BAND Dark Factory hackathon · Tablekeeper track

Culltron (Pty) Ltd · Ashveer Ramlukan, founder

github.com/CulltronOrg/dark-factory-tablekeeper

The problem

- A guest wants a table. They should not have to phone, wait, or guess.
- Plans change. Moving or cancelling a booking is often harder than making one.
- The track asks for the full cycle: search, book, move, cancel.
- We also want to show that a small agent team can build and check that cycle.

The product

- Search: find an open table for a date, time and party size
- Book: hold the table and confirm it to the guest
- Move: change the time or date of an existing booking
- Cancel: release the table so someone else can take it

How a booking works

1. Guest searches for a table
 2. Guest picks a slot and books it
 3. Guest moves the booking when plans change
 4. Guest cancels when they cannot make it
- Each step is a separate, testable action in the app

Three agent seats

- Three agent seats comment on every action:
- Coordinator: says what the step was meant to do
- Implementer: says what the service did
- Reviewer: checks the outcome in plain language
- The booking engine stays the only authority; seat notes are advisory

What is running now

- The app is live on Azure Container Apps
- Search, book, move and cancel all work end to end
- The three seats answer live through Azure OpenAI (gpt-5-mini) in about 2 seconds
- If the model is unavailable, the app keeps working with simulated seats
- 68 local tests pass; the public repo is open

Honest limits

- This is not a judged Band room run; there is no room.json
- Bookings and accounts are held in memory and reset on restart
- One demo restaurant, The Late Room
- Agent notes describe each step; they do not make booking decisions

What the judges will see

- A 2.5-minute video: youtu.be/6mPcC5qp_Og
- A live recording of a guest searching, booking, moving and cancelling a table
- The table stays selected through sign-up; no reference code to keep
- The live demo and test steps are in the repo README
- The code is in the public repo for anyone to check

Who we are

- Culltron (Pty) Ltd, founded by Ashveer Ramlukan
- Bootstrapped
- No revenue, user or award claims; this is a hackathon build

The ask

- Watch the video: youtu.be/6mPcC5qp_Og
- Try the live demo (link in the README)
- Judge the full guest cycle: search, book, move, cancel
- Read the repo: github.com/CulltronOrg/dark-factory-tablekeeper
